

Build a Motor insurance Portal

1.1 Business Process Documentation

Idea: Build a system to vehicles insurance

Objective: The customer is served quickly, with fast and clear steps.

Step1

Enter the portal – Login Through national access or ID number (To automatically retrieve data)

Step2

The customer is shown a list of their registered vehicles and age (without manual data entry) - thanks to the API model that links entities together by entering specific data provided by the user. This then displays a list of vehicles linked to the ID number entered during login.

Step3

Select a vehicle and Determine the type of insurance – (Comprehensive insurance) :

- Driving in the GCC
- Dealership Maintenance
- Roadside Assistance

Step4

Review offers – compare prices and choose the appropriate offer

Step5

Electronic payment – (Apple pay, Mada, Visa etc..)

Step6

Receiving the insurance policy – download it directly, and also send a copy to customer email.
